A LATINO PAIR GROUPOID

## 9 GROUPOID'S ANATOMY:

ON LIE GROUPS, LOCAL & GLOBAL DIFFERENTIAL STRUCTURE IS ENCODED by THE LEFT RESP. RIGHT REGULAR ACTION  $L$ . RESP.  $P$ .  
ON LIE GROUPOIDS, THINGS GET SUBTLER AS THEY ACT ON THEMSELVES ONLY FIBREWISE...

DEF. 31. FOR ANY LIE GROUPOID  $(M, g, s, t, Id, Inv, m)$ ,  
OR FOR ANY  $g \in s^{-1}(\{x\}) \cap t^{-1}(\{y\})$ , THE **LEFT-TRANSLATION**  
by  $g$  IS THE SMOOTH MAP

$$l_g : t^{-1}(\{x\}) \rightarrow t^{-1}(\{y\}) : h \mapsto g \cdot h.$$

THE **RIGHT-TRANSLATION** by  $g$  IS THE SMOOTH MAP

$$p_g : s^{-1}(\{y\}) \rightarrow s^{-1}(\{x\}) : h \mapsto h \cdot g.$$

IN PHYSICAL APPLICATIONS, EXISTENCE of a FIBREWISE ACTION IS NOT GOOD ENOUGH, & SO WE LOOK for GENERALISATIONS of, say, l...

REPLACE:  $g \mapsto g(\cdot)$

$$t(\ddot{g}) \equiv M$$

$$\downarrow$$

$$g$$

with  $s(g(x)) = t(t^{-1}(x)) \equiv x$

THE REQUIREMENT THAT SUCH AN ACTION BE A DIFFEOMORPHISM IMPLIES THAT ITS RESTRICTION TO  $M$  HAS THIS PROPERTY, i.e.,  $t \circ g \in \text{Diff}(M)$ . THIS LEADS to...

**Definition 31** ([MMr03]). Let  $\mathbf{Gr} = (M, \mathcal{G}, s, t, \text{Id}, \text{Inv}, \cdot)$  be a Lie groupoid. A (global) **bisection** of  $\mathbf{Gr}$  is a section  $\sigma: M \rightarrow \mathcal{G}$  of the surjective submersion  $s: \mathcal{G} \rightarrow M$  such that the induced map

$$t_*\sigma \equiv t \circ \sigma: M \rightarrow M$$

is a diffeomorphism. Equivalently, it is a submanifold  $S \subset \mathcal{G}$  with the property that both restrictions:  $s|_S$  and  $t|_S$  are diffeomorphisms. We shall denote the set of bisections as  $\text{Bisec}(\mathbf{Gr})$ .

A **local bisection** of  $\mathbf{Gr}$  is a local section  $\sigma: O \rightarrow \mathcal{G}$  of  $s$  over an open subset  $O \subset M$  such that the induced map

$$t_*\sigma \equiv t \circ \sigma: O \rightarrow t \circ \sigma(O)$$

is a diffeomorphism. We shall denote the set of local bisections as  $\text{Bisec}_{\text{loc}}(\mathbf{Gr})$ .

**Definition 32**. The **group of bisections** of  $\mathbf{Gr}$  is the canonical structure of a group on  $\text{Bisec}(\mathbf{Gr})$ . Its binary operation is defined as

$$\cdot: \text{Bisec}(\mathbf{Gr}) \times \text{Bisec}(\mathbf{Gr}) \rightarrow \text{Bisec}(\mathbf{Gr}): (\sigma_2, \sigma_1) \mapsto \sigma_2(t \circ \sigma_1(\cdot)) \cdot \sigma_1(\cdot) \equiv \sigma_2 \cdot \sigma_1.$$

The neutral element is  $\text{Id}$ , termed the **unit bisection** in the present context, and the corresponding inverse is

$$\text{Inv}: \text{Bisec}(\mathbf{Gr}) \rightarrow \text{Bisec}(\mathbf{Gr}): \beta \mapsto \text{Inv} \circ \beta \circ (t_*\beta)^{-1} \equiv \beta^{-1}.$$

GEOMETRIC  
PICTURE

E.g.,

Ex. 34. For  $G \equiv \hat{G}$ , we find  $\text{Bisec}(\hat{G}) \simeq G$ .

Ex. 35. For  $G \equiv \text{Pair}(M)$ , we find  $\text{Bisec}(\text{Pair}(M)) \simeq \text{Diff}(M)$ .

Ex. 36. For  $G \equiv \text{Pair}_\Sigma(M)$ , we find

$$\text{Bisec}(\text{Pair}_\Sigma(M)) \simeq \text{Aut}_{\text{Bun}(\Sigma)}(M | \text{id}_\Sigma) =: \text{Aut}_{\text{Bun}(\Sigma)}(M)_{\text{vert.}}$$

Ex. 37. For  $G \equiv G \ltimes_\lambda M$ , we find

$$\text{Bisec}(G \ltimes_\lambda M) \simeq \{ f : M \rightarrow G \mid (m \mapsto \lambda_{f(m)}(m)) \in \text{Diff}(M) \}$$

Ex. 38. For  $G \equiv \hat{M}$ , we find  $\text{Bisec}(\hat{M}) = \{\text{id}_M\} \simeq 1$ .

# B-ACTIONS :

**Definition 39.** The **left regular action of  $\mathbb{B}$  (on itself)** is

$$\ell: \mathbb{B} \times \mathbb{B} \longrightarrow \mathbb{B}: (\gamma, \beta) \longmapsto \gamma \cdot \beta \equiv \ell_\gamma(\beta),$$

and the **right regular action of  $\mathbb{B}$  (on itself)** is

$$\wp: \mathbb{B} \times \mathbb{B} \longrightarrow \mathbb{B}: (\beta, \gamma) \longmapsto \beta \cdot \gamma \equiv \wp_\gamma(\beta).$$

The **adjoint action of  $\mathbb{B}$  on itself** is

$$c: \mathbb{B} \times \mathbb{B} \longrightarrow \mathbb{B}: (\gamma, \beta) \longmapsto \gamma \cdot \beta \cdot \tilde{\gamma}^{-1} \equiv c_\gamma(\beta).$$

**Definition 40.** The **shadow action of  $\mathbb{B}$  on  $M$**  is

$$t_*: \mathbb{B} \times M \longrightarrow M: (\sigma, m) \longmapsto t(\sigma(m)).$$

By the usual abuse of the notation, we shall refer by the same name and use the same symbol for the group homomorphism

$$t_*: \mathbb{B} \longrightarrow \text{Diff}(M).$$

**Definition 41.** The **left-multiplication of  $\mathcal{G}$  by  $\mathbb{B}$**  is the left action

$$L: \mathbb{B} \times \mathcal{G} \longrightarrow \mathcal{G}: (\sigma, g) \longmapsto \sigma(t(g)).g \equiv L_\sigma(g) \equiv \sigma \triangleright g.$$

The **right-multiplication of  $\mathcal{G}$  by  $\mathbb{B}$**  is the right action

$$R: \mathcal{G} \times \mathbb{B} \longrightarrow \mathcal{G}: (g, \sigma) \longmapsto g.(\sigma^{-1}(s(g)))^{-1} \equiv R_\sigma(g) \equiv g \triangleleft \sigma.$$

The **conjugation of  $\mathcal{G}$  by  $\mathbb{B}$**  is the left action

$$C: \mathbb{B} \times \mathcal{G} \longrightarrow \mathcal{G}: (\sigma, g) \longmapsto \sigma(t(g)).g.\sigma(s(g))^{-1} \equiv C_\sigma(g) \equiv \sigma \triangleright g \triangleleft \sigma^{-1}.$$

ON ITSELF

ON M

ON  $\mathcal{G}$

IT IS NOT HARD TO SEE THAT GENERICALLY THERE EXIST ARROWS WITH NO GLOBAL BISECTIONS through them (SEE: **Rem. 45.**). HENCE,

**Definition 42.** A Lie groupoid  $\mathcal{G}$  is called **Id-reducible** if for each  $g \in \mathcal{G}$  there exists  $\beta \in \mathbb{B}$  such that  $g = \beta(s(g))$ , i.e., if there is a global bisection through every arrow.

**Remark 43.** The name is justified by the following simple observation: The condition  $g = \beta(s(g))$  is satisfied iff  $g = R_\beta(\text{Id}_{t(g)})$ . Note, e.g., that the action groupoid of Ex. **25** is manifestly Id-reducible.

HOWEVER,

**Theorem 44.** [ZCL09, Thm. 3.1] Every Lie groupoid with connected fibres of the source map is Id-reducible.

**Remark 45.** The significance of the assumption of  $s$ -connectedness of  $\mathcal{G}$  is emphasised by the following counter-example, which we borrow from Ref. [SWo16, Rem. 2.18 b)]. Take any two non-diffeomorphic manifolds  $M$  and  $N$ , and consider the pair groupoid  $\text{Pair}(M \sqcup N) \equiv \mathbf{Gr}$  of their disjoint union, with  $\text{Bisec}(\mathbf{Gr}) \cong \text{Diff}(M \sqcup N)$ . Pick arbitrary points  $m \in M$  and  $n \in N$ . Clearly, there is no global bisection through  $(n, m) \in \text{Mor } \mathbf{Gr}$  (here, we view  $M$  and  $N$  as submanifolds in  $M \sqcup N$ ) as there is no (global) diffeomorphism  $M \rightarrow N$ , which could map  $m \mapsto n$ .

THE SITUATION CHANGES DRAMATICALLY, AND CONSEQUENTLY, TOO, WHEN WE PASS FROM GLOBAL TO LOCAL BISECTIONS...

PROP. 46. FOR ANY LE GROUPOID  $G = (M, \ell, s, t, Id, Inv, m)$  & ANY  
 ARROW  $g \in \mathcal{G}$ , THERE EXISTS A LOCAL BISECTION  $\beta \in \text{Bis}_{\text{loc}}(G)$   
 ON A NEIGHBOURHOOD of  $s(g)$  s.t.  $g = \beta(s(g))$ .

PROOF: WE CONSIDER THE TANGENTS of  $s$  &  $t$  at  $g$ . BOTH MAPS  
 ARE SUBMERSIVE, & SO WE CAN USE THE FOLLOWING

LEMMA 47. LET  $V, W_1, W_2 \in \text{Vect}_{\mathbb{K}}^{<\infty}$  with  $W_1 \xrightarrow{\omega} W_2$ , & LET  
 $\chi_A \in \text{Hom}_{\mathbb{K}}(V, W_A)$ ,  $A \in \{1, 2\}$  BE EPI. THERE EXISTS A SUBSPACE  
 $\Delta \subset V$  WITH PROPERTY  $\chi_A|_{\Delta}: \Delta \xrightarrow{\cong} W_A$ ,  $A \in \{1, 2\}$ .

PROOF of LEMMA: WITHOUT ANY LOSS of GENERALITY, WE MAY  
 ASSUME  $W_1 = W_2 \equiv W$  (IT SUFFICES to CONSIDER  $\tilde{\chi}_2 := \omega \circ \chi_2$  instead of  $\chi_2$ ). (21)

DENOTE  $D = \dim_K W$ . PICK ANY  $\{v_i\}_{i \in \overline{1,D}}$  s.l.

$$W = \langle \chi_1(v_i) \mid i \in \overline{1,D} \rangle_K.$$

IF THE  $\chi_2(v_i)$  ARE LINEARLY INDEPENDENT, THEN  $I := \langle v_i \mid i \in \overline{1,D} \rangle_K$

IS THE SOUGHT-AFTER SUBSPACE, i.e.,  $\Delta = I$ .

IF NOT, ASSUME - WITHOUT LOSS OF GENERALITY - THAT

$$\chi_2(I) \equiv \langle \chi_2(v_j) \mid j \in \overline{1,k} \rangle_K \quad (\text{POSSIBLY } k=0).$$

WE HAVE  $V = I \oplus \ker \chi_1$ , & SO THERE EXIST VECTORS

$$\xi_a \in \ker \chi_1, a \in \overline{k+1,D} \text{ s.t. } \langle \chi_2(v_j), \chi_2(\xi_a) \mid j \in \overline{1,k} \wedge a \in \overline{k+1,D} \rangle_K = W.$$

WE MAY THEN TAKE  $\delta_l := \begin{cases} v_l & \text{for } l \in \overline{1,k} \\ v_l + \xi_l & \text{for } l \in \overline{k+1,D} \end{cases}$  TO OBTAIN

$$\Delta = \langle \delta_l \mid l \in \overline{1,D} \rangle_K. \quad \square$$

(22)

IN VIRTUE of **LEMMA 47**, THERE EXISTS  $\Delta \subset T_g G$  s.t.

$$\Delta \oplus \text{Ker } T_g t = T_g G = \Delta \oplus \text{Ker } T_g s.$$

CONSIDER NEIGHBOURHOODS of  $g \in G$  &  $s(g) \in M$  with RESPECTIVE COÖRDS s.t. THE CORRESPONDING COORDINATE PRESENTATION of  $s$  IS

$$\text{pr}_1 : \mathbb{R}^{\dim M} \oplus \mathbb{R}^{\dim G - \dim M} \cong \mathbb{R}^{\dim M} \longrightarrow \mathbb{R}^{\dim M}$$

with THE COORDINATE DERIVATIONS COINCIDING with THE BASIS of  $\Delta$  &  $\text{Ker } T_g s$  (i.e., COÖRDS ADAPTED to THE SPLITTING  $\Delta \oplus \text{Ker } T_g s$ )

TAKE A LOCAL SECTION  $\sigma$  of  $s$  with THE CANONICAL PRESENTATION in THE CHOSEN COÖRDS. By CONSTRUCTION  $T_g(t \circ \sigma)$  IS ISO, & SO - by THE INVERSE-FUNCTION THEOREM -  $t \circ \sigma$  IS DIFFEO on SOME NEIGHBOURHOOD  $\mathcal{U}$  of  $s(g)$ . WE THEN TAKE  $\beta \equiv \sigma|_{\mathcal{U}}$ . □ (23)

PROP. 48. FOR ANY LIE GROUPOID  $Gr = (M, g, s, t, Id, Inv, m)$   
 & ANY  $m \in M$ , THE RESTRICTION  $t|_{s^{-1}(\{m\})}$  OF  $t$  TO THE SOURCE  
 FIBRE HAS CONSTANT RANK.

PROOF: CONSIDER ANY TWO POINTS  $g, h \in s^{-1}(\{m\})$ .

AS  $t(g^{-1}) = s(g) = m = s(h)$ , THE ARROW  $h \cdot g^{-1}$  IS WELL-DEFINED,

& SO THERE EXISTS A LOCAL BISECTION  $\beta \in \text{Bisec}(Gr)_{loc}$   
 WITH THE PROPERTY  $\beta(t(g)) = \beta(s(h \cdot g^{-1})) = h \cdot g^{-1}$ , WHICH  
 IMPLIES  $\tilde{t}_* \beta(t(g)) = t(h \cdot g^{-1}) = t(h)$  FOR (SEE: DEF. 39.)

$$\tilde{t}_* : \text{Bisec}(Gr)_{loc} \rightarrow \text{Diff}(M)_{loc}$$

$$: \beta \longmapsto t \circ \beta$$

DENOTE  $U := \text{Dom}(\beta) \subset M$  &  $V := \tilde{t}_* \beta(U) \subset M$ , (24)

SO THAT WE OBTAIN THE DIFFEOMORPHISM (SEE: DEF. 40.)

$$\tilde{L}_\beta : t^{-1}(u) \xrightarrow{\sim} t^{-1}(v) : k \mapsto \beta(t(k)) \cdot k.$$

NOTE THAT  $\tilde{L}_\beta(g) \equiv \beta(t(g)) \cdot g = h \cdot g^{-1} \cdot g = h$ .

AS  $s \circ \tilde{L}_\beta = s$ , WE SEE THAT  $\tilde{L}_\beta$  RESTRICTS TO A DIFFEO  
ON EACH  $s$ -FIBRE WITHIN  $t^{-1}(u)$ . (THE STATEMENT MAKES SENSE  
IN VIRTUE OF THE CONSTANT-RANK LEVEL-SET THEOREM [Lee 2012, Thm 5.12]  
AS THE  $s$ -FIBRES ARE PREIMAGES OF POINTS IN  $M$  ALONG  
THE SUBMERSION  $s$ .) MOREOVER,

$$t \circ \tilde{L}_\beta = t \circ \beta \circ t \equiv \tilde{t}_* \beta \circ t,$$

AND SO WE HAVE A COMMUTATIVE DIAGRAM

$$\begin{array}{ccc}
 t^{-1}(U) \cap s^{-1}(\{m\}) & \xrightarrow{\tilde{L}_\beta \upharpoonright_{s^{-1}(\{m\})}} & t^{-1}(V) \cap s^{-1}(\{m\}) \\
 \downarrow t|_{s^{-1}(\{m\})} & \searrow \mathcal{I} & \downarrow t|_{s^{-1}(\{m\})} \\
 U & \xrightarrow{\tilde{t}_* \beta} & V
 \end{array}$$

THE HORIZONTAL ARROWS IN IT REPRESENT DIFFEOS, OF WHICH THE UPPER ONE TAKES  $g$  TO  $h$ . HENCE,

$$\text{rk } t(g) = \text{rk } t(h). \quad \square$$

THE LAST RESULT HAS IMPORTANT CONSEQUENCES...

DEF. 49. LET  $Gr = (M, G, s, t, Id, inv, m)$  BE A LIE GROUPOID, & LET  $m \in M$  BE ARBITRARY. THE ISOTROPY GROUP of  $m$  IS THE SUBSET

$$g_m := s^{-1}(\{m\}) \cap t^{-1}(\{m\}) \subset G$$

with the MULTIPLICATION & INVERSE MAPS of  $G$  RESTRICTED to  $\pi$ , & with  $\bullet \mapsto Id_m$  AS THE GROUP UNIT.

PROP. 50. THE ISOTROPY GROUP of ANY POINT in the OBJECT MANIFOLD of A LIE GROUPOID IS A LIE GROUP.

PROOF: FIX  $m \in M$ . THE ISOTROPY GROUP  $g_m$  IS THE PREIMAGE of  $\{m\}$  along the RESTRICTION of  $t$  to the  $s$ -FIBRE  $s^{-1}(\{m\})$ . BUT by PROP. 48.,  $t|_{s^{-1}(\{m\})}$  HAS CONSTANT RANK, & SO - (27)

IN VIRTUE OF THE CONSTANT-RANK LEVEL-SET THEOREM [Lee 2012, Thm 5.12]

$G_m$  IS A SUBMANIFOLD IN  $S^{-1}(\{m\})$ , I.E.) IT IS, IN PARTICULAR,  
A MANIFOLD. NOW, THE RESTRICTIONS OF  $m$  &  $\text{Inv}$  TO  
 $G_m$  ARE SMOOTH, & SO THE QUADRUPE

$$(G_m, m|_{G_m \times G_m}, \text{Inv}|_{G_m}, \cdot \mapsto \text{Id}_m)$$

IS A GROUP OBJECT IN  $\text{Man}$ , I.E., A LIE GROUP.  $\square$
